

DARTS Shipping System

An Interactive System for Food and Beverage Distribution

The Right Products on the Right Trucks

The *ground breaking* DARTS Shipping System focuses on ensuring the correct products in the correct quantities are delivered to the correct dock doors and loaded onto the correct trucks, thus significantly reducing product waste while promoting higher product delivery accuracy to meet the marketplace needs.

The *benefits* are dramatic and clear: Savings in waste reduction; increase sales opportunities, increase in customer satisfaction; promote brand/product loyalty; increase profits; increase in personnel productivity; assurance for continued long term profits. The ability to effect and record last minute order adjustments due to over production (over) or under production (short) as well as the ability to adjust and record pre-deadline, production order changes allows for accurate information to be used in the production, planning and shipping processes.

In most instances the *'return on investment'* is realized in less than one year with the implementation of the DARTS Shipping System for food and beverage producers and bottlers.

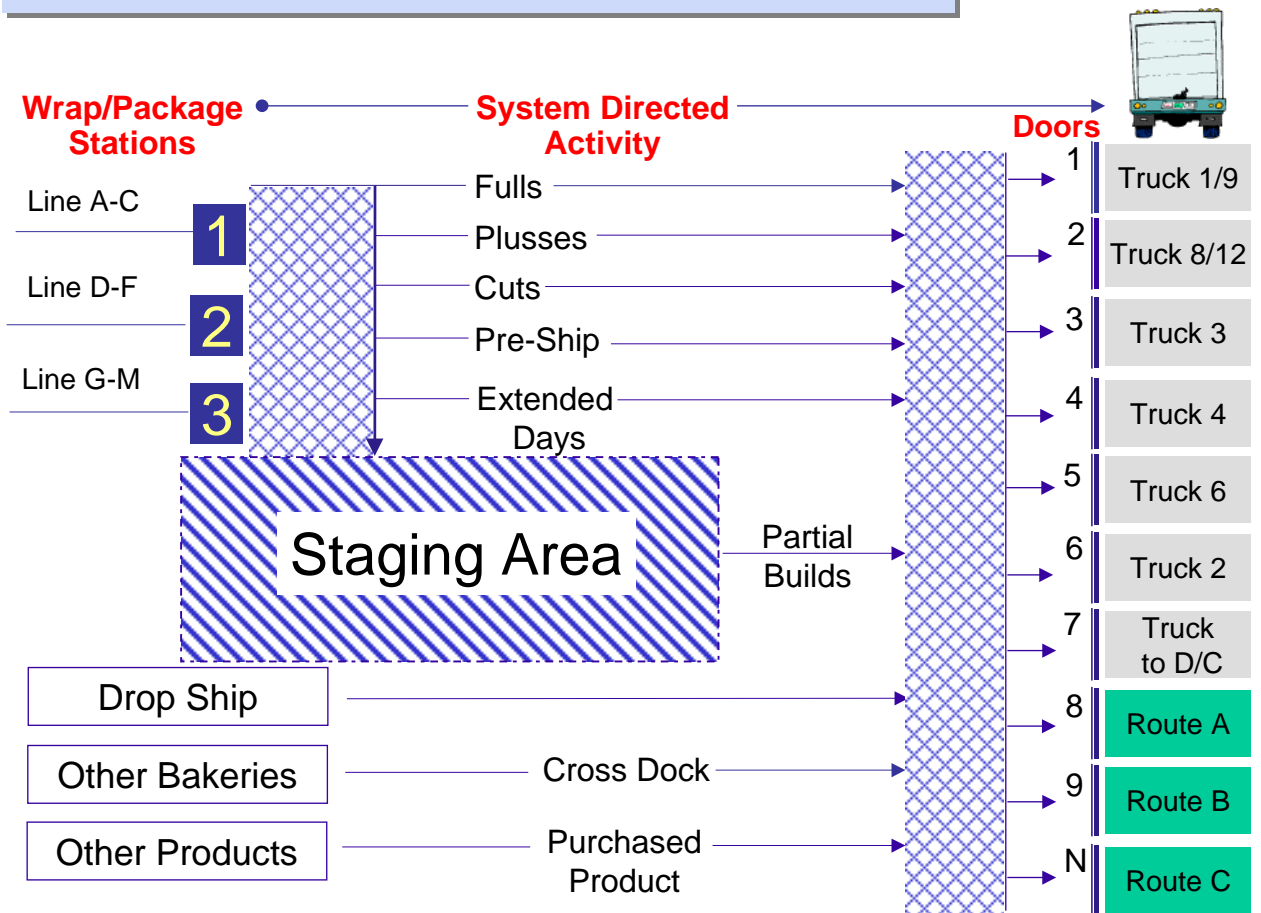

System functionality supports the *new product tracking requirements* recently brought on the Food and Beverage industry as a result of the Bioterrorism Act. *Asset tracking* is a benefit that can be added into the systems capabilities.

The DARTS Shipping System embraces *new technology* with the integration of *Voice Recognition, RFID, and Java Virtual Machine (JVM)*. This new technology along with development experts with keen industry understanding has resulted in an *interactive system* that effectively and efficiently monitors activity, directs shippers, and provides management with the ability to easily enter 'real time' changes to product or transport data as they occur. The system immediately processes any ad hoc data entered, records and stores the results for future reference, and, when appropriate, adjusts the directives to shippers in the allocation/shipping process. The system interfaces with the company's standard operations and production information. Daily changes resulting from dynamically occurring events in a given day are easily entered into the system without permanently altering standard operating and production information.

Hardware independent, the DARTS Shipping System supports complete flexibility in the hosting function and in choice of hand held devices. The system provides management with tools with which to monitor, manage, and report and interfaces with all the leading host systems.
